WEQUOTE CRM - AUTOMATION ROADMAP AND PRODUCT REQUIREMENTS

Automation Roadmap Phase 1 to Phase 3

A presentation-ready source of truth for Product, Design and Engineering. It explains why delivery is split into three phases, defines the complete Phase 1 Quote Lifecycle Automation experience, and sets the product boundaries for Quote-connected Custom Stages and Fully Custom Pipelines.

Delivery sequence

Phase 1: fixed Quote Lifecycle Automation. Phase 2: Custom Stage overlays inside a Quote-connected Pipeline. Phase 3: standalone Fully Custom Pipelines with customer-controlled Stage progression.

DOCUMENT STATUS	RELEASE	AUDIENCE
Draft for stakeholder alignment	Roadmap + CRM Phase 1 PRD	Product - Design - Engineering

Prepared for stakeholder review and developer handoff

Contents

The document is deliberately divided into presentation-sized sections. Page numbers update automatically when content changes.

1. Product roadmap - why three phases

The three phases deliberately add flexibility in increasing levels of structural risk. We first prove safe Automation editing against a stable system lifecycle, then allow controlled Stage overlays, and only then introduce Pipelines with no protected Quote progression.

PHASE	CUSTOMER CAPABILITY	SYSTEM GUARANTEE	WHY THIS ORDER
Phase 1 **Fixed Quote Lifecycle**	Create and edit Automations inside Qualified, In Progress, In Review, Passed Review, Sent, Won and Lost. Use a Template or start from scratch. Apply to All Companies or selected Companies.	Quote events remain the only mechanism that changes a protected Stage. No Custom Stages. Every Deal has one Owning Company.	Establish the Builder, Company scope, Shared Core blocks, Draft/Test/Publish safety and runtime behaviour before structural editing.
Phase 2 **Quote-connected Custom Stages**	Insert one or many customer-defined Stages into the five allowed lifecycle gaps. Add CRM Deal forecast views and weighted probabilities.	Protected Quote milestones remain fixed. Every inserted Stage inherits the same Core library and a read-only lifecycle segment context.	Adds placement, mapping, migration, forecast and impact-preview complexity while preserving trusted Quote progression.
Phase 3 **Fully Custom Pipeline**	Create a standalone operational Pipeline in which every Stage is customer-defined and explicit Stage-to-Stage moves are allowed.	No automatic Quote-to-Deal Stage syncing and no protected Quote milestones. Stage names never infer logic.	Introduces the highest level of customer control only after generic events, Rules, Actions and movement safety are proven.

One platform principle across all phases

Starts when, Rules and Actions come from reusable catalogues. What changes by phase is the Pipeline structure, the available runtime context and who controls Stage progression - not a fresh Automation engine for every Pipeline type.

Roadmap boundary

Phase 1 includes Company scope for Automation enrollment and multi-Quote Deal-stage aggregation. CRM Deal forecast, weighted probabilities and forecast controls are Phase 2. Filters and sorting are not specified in this PRD version.

Definition of each phase

Phase 1 is the committed delivery baseline

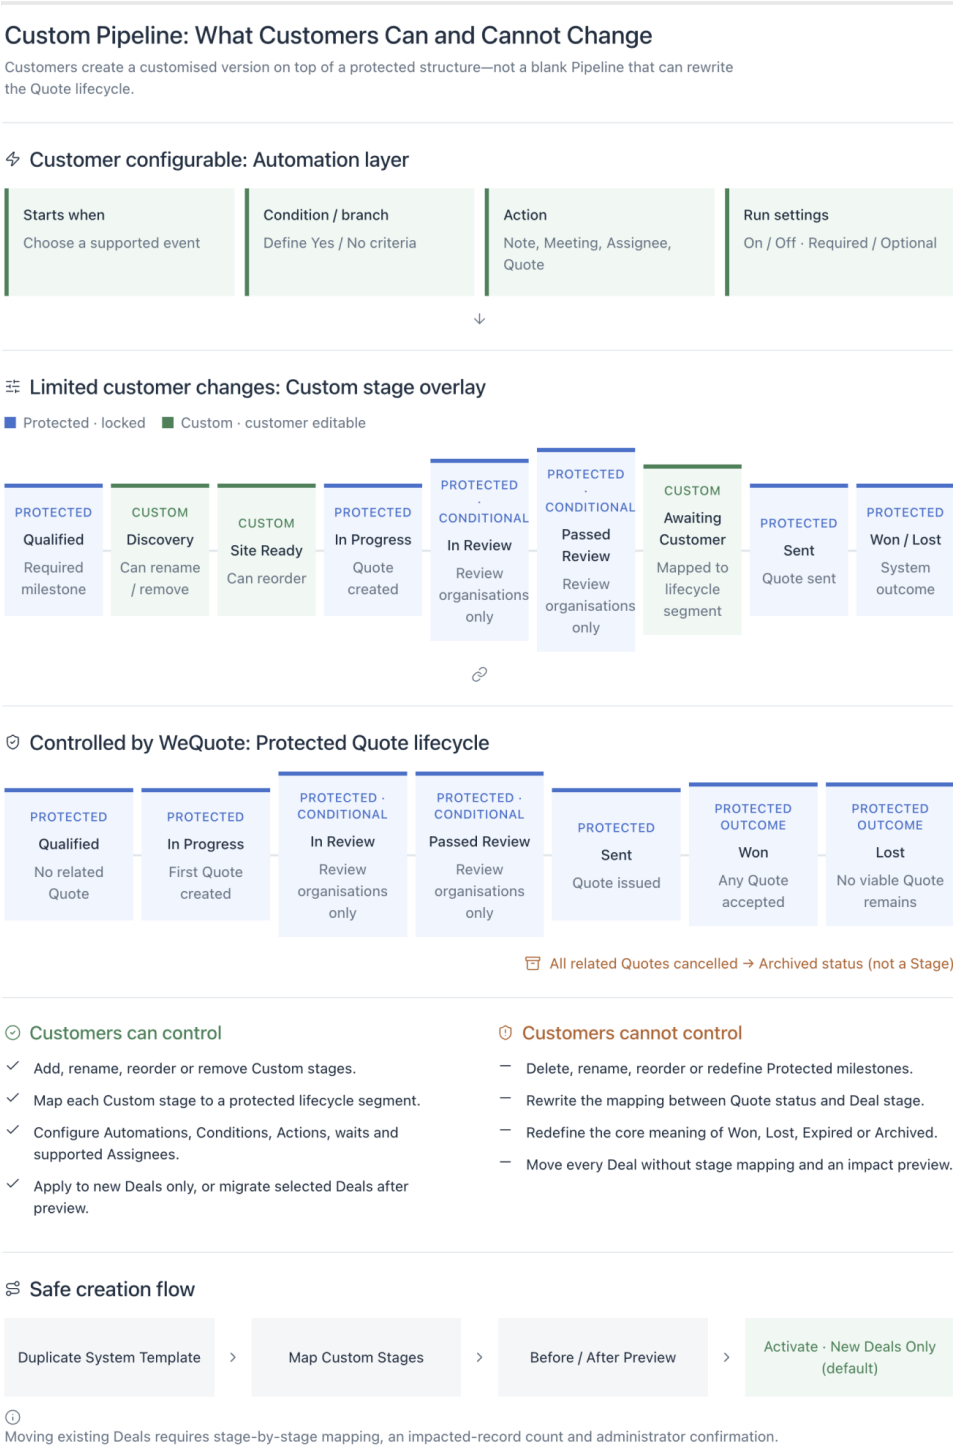

Detailed requirements, Templates, screens and acceptance criteria in this document apply to the current prototype and developer handoff.

Phases 2 and 3 are product direction

These sections define non-negotiable architecture and UX boundaries so Phase 1 does not create a dead end. They are not Phase 1 scope.

2. Customer control boundary across phases

This overview shows the long-term destination: customers gain more Pipeline control over time, but Quote-derived sales truth remains protected whenever a Pipeline is Quote-connected.

How to read this screen

Phase 1 uses the protected lifecycle and editable Automation layer only. Phase 2 adds the green Custom Stage overlay and safe creation/migration flow. Phase 3 creates a separate Fully Custom Pipeline rather than removing protection from an existing Quote-connected Pipeline.

Evidence and proposal classification

Every diagram and requirement in the rest of this PRD must be read through one of these four labels. This prevents current WeQuote behaviour from being confused with CRM work that still has to be built.

CURRENT WEQUOTE UI	PHASE 1 TARGET	PHASE 2 PROPOSAL	PHASE 3 PROPOSAL
Per-Quote statuses; conditional Quote Review; Mark As Sent; Mark As Accepted; proposal viewing events; Trading Name selected on a Quote.	Deal and protected Pipeline Stages; multi-Quote aggregation; Company scope; Next Action; Deal labels; Watchers; Interests; Expected Close; CRM file requests and Automation runtime.	Custom Stage overlay inside Quote lifecycle; migration preview; CRM Deal forecast and weighted probabilities.	Fully Custom Pipelines with explicit customer-controlled Stage movement and no protected Quote progression.

Existing company terminology

Current WeQuote supports a Company profile plus optional Trading Names. A Quote can select which Trading Name issues it. Phase 1 CRM Company scope is a new enrollment concept: it controls which Deals may run an Automation and must not be presented as already existing.

Existing files terminology

Current Notes and Documents stores a document name plus URL link. Phase 1 Request file, required upload, reminder and completion state are a new CRM file-request model, even if the wider product roadmap also introduces real file upload.

Existing sales reporting terminology

Current Sales Overview already groups accepted / complete Quotes as Won and shows proposal Seen status. The new CRM Deal Forecast view is a separate Phase 2 proposal; this PRD does not relabel the current Sales Overview as a Phase 1 CRM forecast.

3. Phase 2 - Quote-connected Custom Stages

Phase 2 keeps the Quote Lifecycle as the source of truth while allowing operational Stages to be inserted into five permitted gaps: Qualified to In Progress, In Progress to In Review, In Review to Passed Review, Passed Review to Sent, and Sent to Won / Lost.

Phase 2 also owns CRM Deal forecast

Stage probability, weighted Deal value, forecast categories and manager forecast views are intentionally deferred until the Phase 1 Deal, Company scope and multi-Quote aggregation model is stable. This does not remove or replace the existing WeQuote Sales Overview.

WHAT CUSTOMERS CAN CHANGE

- Add, rename, reorder or remove Custom Stages
- Create independent Automations in each Custom Stage
- Move between named Custom Stages when explicitly configured
- Preview impact before migrating existing Deals

WHAT REMAINS PROTECTED

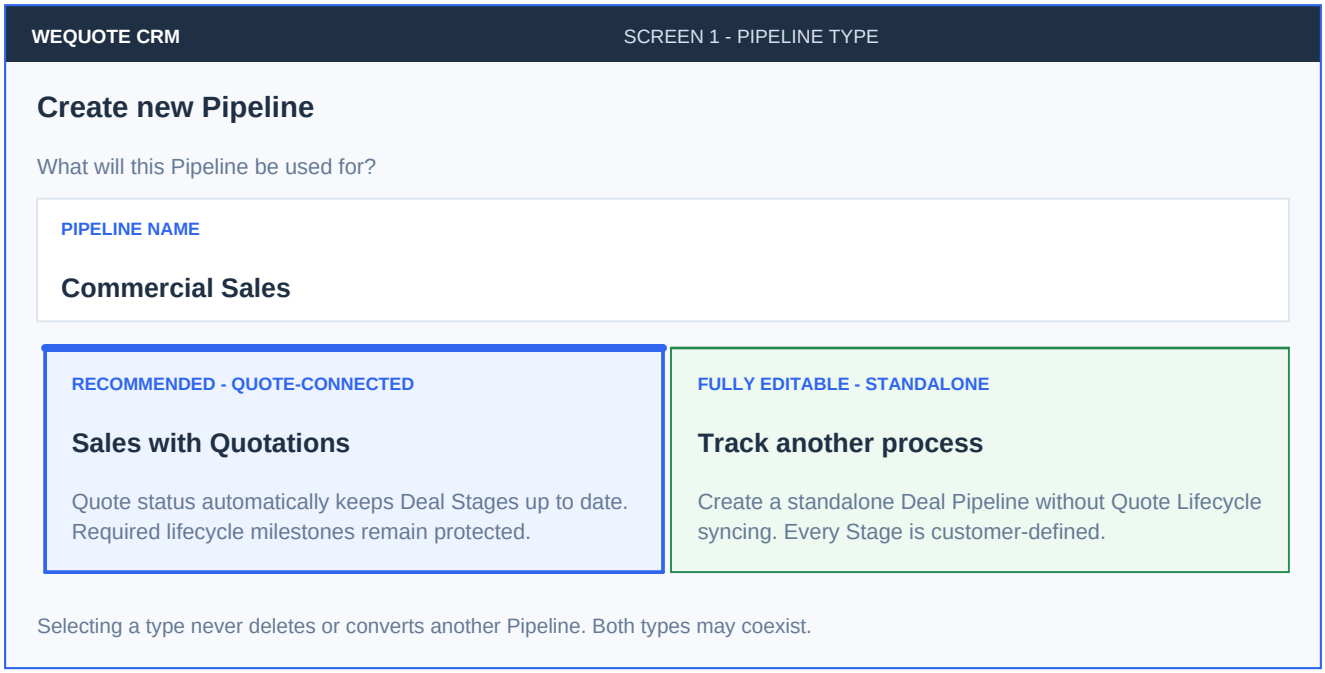

- Qualified, In Progress, In Review, Passed Review, Sent, Won and Lost
- Quote-status-to-Deal-Stage mapping
- Protected outcome meaning
- The trusted Quote event that exits each lifecycle segment

Non-negotiable developer contract

Every Custom Stage opens the exact same Core Starts when, Rules and Actions block IDs. Placement changes lifecycle context, valid target values and the protected system event - it must never select a different Core library.

Phase 2 screen - choose the Pipeline type before creation

The customer chooses Sales with Quotations or Track another process at the beginning. The choice is structural and remains visible before the Pipeline is created.

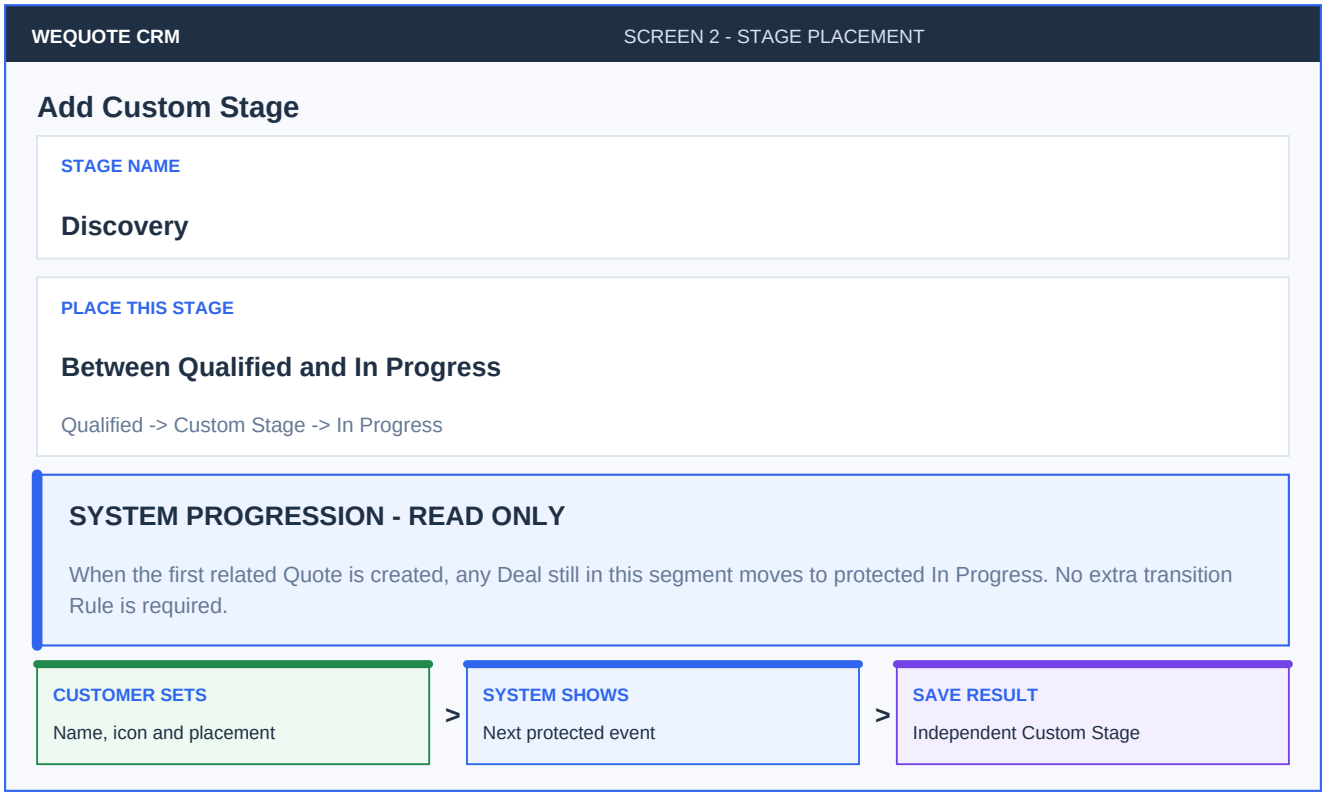

Roadmap decision

Keep the two Pipeline types explicit. A Quote-connected Pipeline can gain Custom Stages later; a standalone Pipeline is never produced by removing the Quote Lifecycle.

Phase 2 screen - add a Custom Stage to a lifecycle segment

The customer names the Stage and chooses its lifecycle placement. The same screen shows the read-only event that exits the selected segment before Add Stage is confirmed.

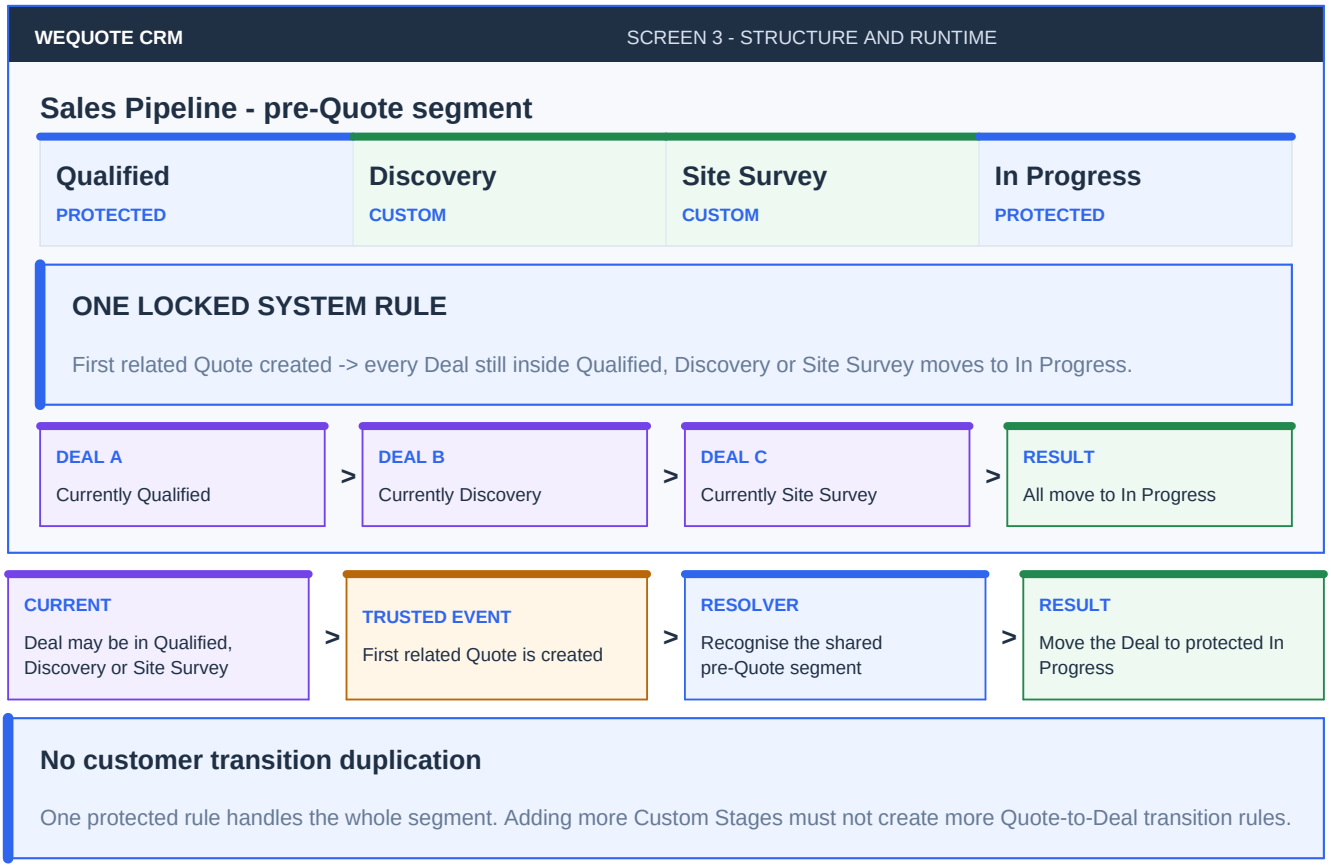

Roadmap decision

The customer configures optional operational Automations; the system owns the single protected event that exits the segment. No duplicate customer transition Rule is required.

Phase 2 screen flow - one system event moves every Deal in the segment

The Pipeline structure groups Qualified plus its inserted Custom Stages into one pre-Quote segment. The screen below shows the complete structure, protected event and runtime result in one view.

Phase 2 developer contract - Shared Core library

Every inserted Custom Stage exposes the same complete catalogue. The native tables below replace the earlier long infographic so every block remains readable in the PDF.

NON-NEGOTIABLE INVARIANT

Stage ID, Stage name and lifecycle placement must not add, remove, rename or disable a Core block. Only feature availability may hide a block when its required CRM module or record data does not exist.

SHARED CORE STARTS WHEN	SHARED CORE RULES	SHARED CORE ACTIONS
• Deal enters this Custom Stage	• Deal is still in this Custom Stage	• Assign Deal Owner
• Deal Owner changes	• Owner or Next Action is missing	• Set or clear Deal Next Action
• Deal Next Action changes or becomes due	• Required task or file is missing	• Create Note or schedule Meeting / Site Visit
• Meeting or Site Visit changes	• Meeting or Site Visit is complete or incomplete	• Add or remove Watcher, Label or Interest
• File is added or a requested file is received	• Recent Activity exists or does not exist	• Request or attach a file
• Deal inactivity or Expected Close approaches	• Label, Interest, Value or Company matches	• Set Expected Close Date or notify internally
• Deal data changes	• Expected Close Date matches	• Move to a named Custom Stage

Same available library - three independently saved Automations

CUSTOM A - INDEPENDENT	CUSTOM X - INDEPENDENT	CUSTOM B - INDEPENDENT
Starts: Deal enters Custom A	Starts: Requested file received	Starts: Next Action due
Rule: Owner is missing	Rule: Required file exists	Rule: No recent Activity
Action: Assign Deal Owner	Action: Create technical Note	Action: Schedule Meeting

Developer assertion

availableCoreBlocks(Custom A) = availableCoreBlocks(Custom X) = availableCoreBlocks(Custom B). Saved selections, configured values, Company scope and Draft/Test/Publish state remain independent.

Phase 2 developer contract - what changes by lifecycle gap

Placement changes the Quote context and the protected event that exits the segment. It does not change the Core Automation catalogue.

STAYS THE SAME
Starts when catalogue

>

STAYS THE SAME
Rules catalogue

>

STAYS THE SAME
Actions catalogue

>

CHANGES
Context and system event

CUSTOM STAGE PLACEMENT	QUOTE CONTEXT	EXAMPLES FROM SAME CORE	READ-ONLY SYSTEM PROGRESSION
1 Qualified -> In Progress	No related Quote is required yet.	Set Next Action; schedule Site Visit; request file.	First related Quote created -> In Progress
2 In Progress -> In Review	A related Quote exists and is being prepared.	Create Note; add Watcher; request file.	Quote submitted for review -> In Review
3 In Review -> Passed Review	Quote is under internal review.	Create Note; add Watcher; notify internally.	Review passes -> Passed Review
4 Passed Review -> Sent	Quote has passed review and is ready to issue.	Attach file; set Next Action; notify internally.	Viable Quote issued -> Sent
5 Sent -> Won / Lost	Quote is customer-facing; view and expiry context exists.	Schedule Meeting; set Next Action; add Label.	Accepted -> Won; no viable Quote -> Lost

Developer rule

Placement selects lifecycle context metadata, Flow Summary wording, valid named target values and the next protected event. Recommended Templates may differ; Core block IDs and permissions must not.

Phase 2 Editor UI - what a Custom Stage actually opens

LEFT WORKFLOW BLOCKS PANEL

Starts when, Actions and Rule remain the three permanent tabs. The customer always sees the same Core library, regardless of the Custom Stage name or lifecycle gap.

PRECISE EVENT CONFIGURATION

Generic cards such as Deal enters this Custom Stage become Stage-specific only after configuration. Requested file is received must reference a real named File Request on the Deal; it cannot appear from nowhere.

CONTEXT, NOT PERMISSION

Lifecycle placement supplies current Quote state, valid Custom Stage targets and the next protected event. It does not hide Core CRM blocks or create a different library.

INDEPENDENT SAVED AUTOMATION

Each Custom Stage stores its own trigger, Rules, Yes / No paths, Actions, Active / Inactive state, Draft, Test state and Company scope.

UI result

Same block picker -> different configured values -> independent saved flow -> read-only protected lifecycle context.

4. Phase 3 - Fully Custom Pipelines

Phase 3 supports customer-defined operational processes that are not governed by the Quote Lifecycle. Every Stage is a label chosen by the customer; the platform must never infer meaning from words such as Review, Sent, Closed or Banana.

STRUCTURE	AUTOMATION LIBRARY	STAGE MOVEMENT
Every Stage is customer-defined. There are no protected Quote milestones inside this Pipeline.	Every Stage opens one generic Starts when, Rules and Actions library. Optional Quote blocks appear only when related Quote data genuinely exists.	Manual move or an explicit Move Deal to [named Stage] Action changes the Stage. Relative 'move to next' logic is not stored.

Relationship to Phase 2

Phase 2 Custom Stages and Phase 3 Fully Custom Stages reuse the same generic CRM Core blocks. They differ in structural context: Phase 2 sits inside protected Quote segments; Phase 3 has no protected progression and therefore exposes explicit Stage-to-Stage movement as the authoritative path.

Phase 3 developer view - one generic library in every Stage

The customer may use any Stage name. The Stage name is inserted into generic wording, while the customer selects the real event, Rule and Action.

New Opportunity	Customer Documents	Banana	Ready to Install	Finished
CUSTOM	CUSTOM	CUSTOM	CUSTOM	CUSTOM

CORE PRINCIPLE

Every Fully Custom Stage opens the same Starts when, Rules and Actions library. Only 'this Stage' and the available named Move Deal targets change.

STARTS WHEN

- Deal is created or enters / leaves this Stage
- Deal stays in this Stage for a set time
- Owner, Watcher, Label, Interest or Value changes
- Next Action or Note follow-up changes
- Meeting or Site Visit status changes
- File uploaded, removed or received
- No activity or a selected date is reached

RULES

- Deal is still in this Stage or came from a named Stage
- Deal stayed here for a set time
- Owner, Watcher, Label or Interest matches
- Value, Margin, Company or Expected Close matches
- Recent Activity or Next Action exists
- Meeting, Note follow-up or required file status matches
- Combine Rules with AND / OR and Yes / No paths

ACTIONS

- Assign Owner; set or clear Next Action
- Add or remove Watcher, Label or Interest
- Create Note or schedule Meeting / Site Visit
- Request or attach a file
- Set Expected Close Date or notify internally
- Move Deal to a named Stage
- End the Automation path safely

The Stage name is inserted into generic wording

GENERIC EVENT	GENERIC TIME EVENT	GENERIC ACTION
Deal enters this Stage	Deal stays in this Stage for 7 days	Move Deal to selected Stage
DISPLAYED	DISPLAYED	DISPLAYED
Deal enters 'Banana'	Deal stays in 'Banana' for 7 days	Move Deal to 'Ready to Install'

What the system never infers

A name such as Review, Sent, Closed or Banana never creates logic, chooses a previous or next Stage, or changes block permissions. Stage name = display label; Automation logic = customer-selected events, Rules and Actions.

5. Phase 1 executive summary

Qualified	In Progress	In Review	Passed Review	Sent	Won	Lost
No Quote	Editable	Conditional	Conditional	Customer-facing	Accepted	No viable Quote

The product decision

A customer creates an Automation inside one fixed Quote Lifecycle Stage through exactly two routes: use a Stage Template, or start from scratch. Both routes use the same Automation Builder and the same Draft, optional Test and Publish lifecycle.

Two customer choices

1 - Use a Stage Template

Copy a recommended flow containing preselected Starts when, Rule and Action blocks. The copied Template becomes an editable, Inactive Draft.

2 - Start from scratch

Build manually from one Global Block Catalogue: Shared Core blocks plus only the Quote-specific Starts when and Rules compatible with the selected Stage.

Not a third choice

The earlier document named 'Automation Blocks Inside Every Protected Stage' was a long-form explanation of Start from scratch. Its useful content is consolidated in this PRD; it is not a separate customer journey or a separate set of libraries.

Problem, goals and non-goals

PROBLEM

Customers need flexible CRM work without being allowed to rename, bypass or redefine the trusted Quote Lifecycle.

GOALS

- Make the two creation routes obvious
- Keep one reusable block catalogue
- Show only Stage-compatible Quote events
- Protect lifecycle progression

NON-GOALS

- No Custom Stages in Phase 1
- No CRM Deal forecast until Phase 2
- No filter or sorting specification in this PRD
- No seven separate libraries
- No Automation Action that approves, sends or derives Won / Lost

6. Phase 1 Company data and Automation scope

Audio Vision is the reference example for a customer with more than one operating or issuing company identity. Phase 1 must let a manager see Deals across those Companies while still assigning each Deal to one required Owning Company. Every Automation then enrolls All Companies or a selected subset.

CURRENT WEQUOTE UI

A Quote can select the Trading Name that issues it. Trading Names have their own name, logo, addresses and VAT number. This is a per-Quote issuing identity, not an Automation enrollment scope.

PHASE 1 TARGET

A Deal stores one Owning Company. Automation scope is All Companies or selected Owning Companies. Related Quotes inherit that Deal Company so runtime eligibility is deterministic.

Audio Vision example data model

CRM RECORD	EXAMPLE	PHASE 1 RULE
Organisation	Audio Vision Group	One WeQuote account can view permitted records across its Companies.
Owning Company	Audio Vision - London	Required on every Deal; used for Automation scope matching.
Other Companies	Audio Vision - Manchester; Audio Vision - Projects	Illustrative names only. A user may switch the CRM view between All Companies and a selected Company.
Related Quote	Quote AV-LON-1042	Inherits the Deal Owning Company / issuing identity. Phase 1 blocks silent cross-company Quote linking.
Automation	Qualified first Next Action	Scope can be All Companies or selected Companies. Scope is stored on every Draft and published version.

Terminology decision required

Product and Engineering must confirm whether an Audio Vision branch is represented by the existing Trading Name entity or by a new CRM Company entity linked to it. The Phase 1 runtime contract does not change: every Deal resolves to one Owning Company ID and Automation scope matches that ID.

Phase 1 screen - choose Company scope when creating an Automation

CREATE AUTOMATION

Qualified - Qualified first Next Action

COMPANY SCOPE

Choose which Deals may enter this Automation.

(selected) All Companies

Runs for every Deal whose Owning Company is visible to this CRM account.

( ) Selected Companies

Choose one or more Companies. Example: Audio Vision - London; Audio Vision - Manchester.

SUMMARY

Pipeline: Sales Pipeline | Stage: Qualified | Scope: All Companies | Status after creation: Inactive Draft

Back

Create Automation

UI LOCATION	REQUIRED DISPLAY
Create Automation	Company scope is required before the Draft is created. Default: All Companies.
Builder Flow Summary	Pipeline, Pipeline Stage and Company scope remain visible while editing any block.
Before / After and Publish	Show a scope change and an impacted-record count before updating the live Automation.
Map and List	Display All Companies or selected Company chips on every Automation card.
Change history	Record old scope, new scope, user, timestamp and published version.

7. Phase 1 Quote status to CRM Pipeline mapping

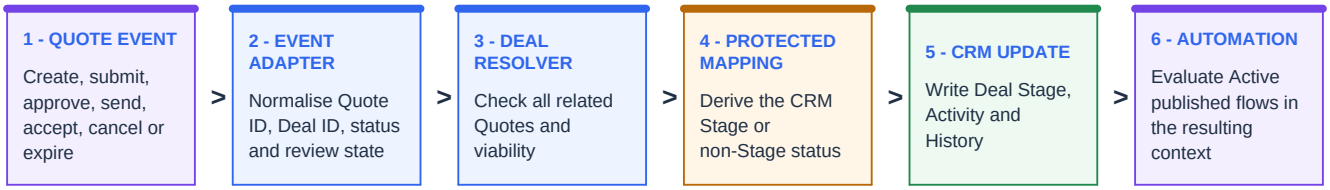

The Quote Lifecycle is not a customer-authored Automation. It is a protected resolver that receives trusted Quote events, evaluates the related Deal and then derives the CRM Stage or non-Stage status. Only after that protected update does the Automation runtime evaluate Stage-scoped flows.

CURRENT WEQUOTE UI FACTS

Quotes store In Progress, optional In Review and Passed Review, Sent, Accepted, Complete and Cancelled states. Expired is derived from Sent plus the expiry date. Proposal viewed and acceptance events are recorded per Quote.

PHASE 1 CRM TARGET

Qualified, Won, Lost and Archived are Deal-level CRM results. The resolver aggregates all related Quotes, writes one protected Deal Stage or status, then starts eligible published Automations.

Canonical transition mapping

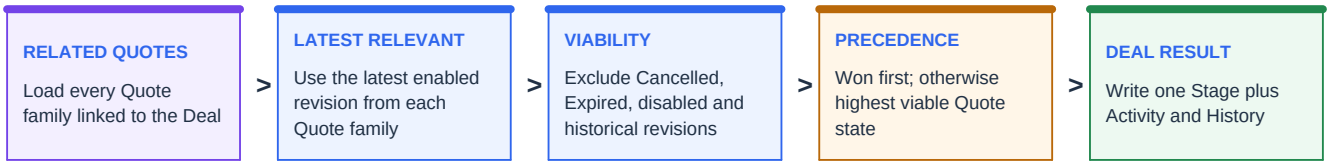

TRUSTED SOURCE SIGNAL	CRM RESULT	PRECONDITION / AGGREGATE RULE	CUSTOMER CONTROL
Deal is qualified and no related Quote exists	Qualified	Entry state before the first Quote	Automation may prepare work; it cannot redefine Qualified
First related Quote is created	In Progress	At least one related Quote now exists	Automation may create the first Quote only where product policy allows
A viable Quote is submitted for internal review	In Review	Quote Review is enabled	Automation cannot submit or simulate reviewer authority
Reviewer passes the Quote	Passed Review	The reviewed Quote remains viable	Automation cannot approve the Quote
Reviewer requests changes	In Progress	Quote returns to an editable build state	Automation may create follow-up work after the transition
A viable Quote is issued to the customer	Sent	Customer-facing Quote is viable	Automation cannot substitute for Send
Any relevant Quote is Accepted or Complete	Won	One accepted / complete Quote is enough to derive the outcome	Won meaning and mapping are protected
No viable related Quote remains	Lost	Excludes the all-cancelled case	Lost meaning and mapping are protected
All related Quotes are cancelled	Archived status	This is not a Pipeline Stage	Customer cannot redefine this as Lost
Sent Quote passes its expiry date	Expired status	Derived from Sent + expiry date; not a Pipeline Stage	Automation may react to expiry but cannot redefine it

Multiple related Quotes

The Deal Stage is an aggregate result, not a copy of whichever Quote changed most recently. One Accepted or Complete relevant Quote derives Won. Lost is derived only when no viable Quote remains. If every related Quote is cancelled, the Deal receives Archived status instead of entering a Lost Stage.

Multi-Quote resolver - one Deal, several Quotes

Phase 1 separates two levels of truth. Each Quote keeps its own WeQuote status and Activity. The CRM Deal resolver then evaluates the latest relevant version of every related Quote and produces one protected Deal Stage.

Aggregate precedence

ORDER	AGGREGATE CONDITION	DEAL RESULT	NOTES
1	Any relevant Quote is Accepted or Complete	Won	Absolute outcome precedence. Other open Quotes do not reopen the Deal.
2	All related Quotes are Cancelled	Archived status	Not a Pipeline Stage and not Lost.
3	At least one viable customer-facing Quote is Sent	Sent	Customer engagement is shown on the Deal card.
4	At least one viable Quote is Passed Review	Passed Review	Only when Quote Review is enabled.
5	At least one viable Quote is In Review	In Review	Only when Quote Review is enabled.
6	At least one related Quote is Draft / In Progress	In Progress	Includes fallback after a later-stage Quote becomes non-viable.
7	No related Quote exists	Qualified	CRM-only pre-Quote entry state.
8	Related Quotes exist, none is accepted, none remains viable, and not all are Cancelled	Lost	Example: every customer-facing option has Expired.

Backward recalculation

If the Quote that supplied the highest active state becomes Cancelled or Expired, the resolver recalculates from the remaining Quotes. Example: Sent + Draft becomes In Progress when the Sent Quote expires. This is a derived correction, not a customer-authored Stage movement.

Multi-Quote scenarios and the Sent Deal card

SENT

Audio Vision boardroom upgrade

3 related Quotes

2 / 3 sent Quotes viewed

Q-1042 Sent - Viewed

Q-1043 Sent - Not viewed

Q-1044 Sent - Viewed

Next Action: Call customer tomorrow

Owner: Emily Wong

Engagement denominator

- Count one latest enabled customer-facing revision per Quote family.
- Include only viable Quotes currently Sent to the customer.
- Exclude Draft, In Review, Passed Review, Cancelled, Expired, disabled and historical revisions.
- Viewed means the customer opened that proposal at least once; detailed viewing time remains on the individual Quote Activity timeline.

RELATED QUOTE STATE	DEAL RESULT	DEAL CARD / BEHAVIOUR
Q1 Sent and viewed; Q2 Draft	Sent	1 / 1 sent Quote viewed. Draft is not in the denominator.
Q1 Sent viewed; Q2 Sent not viewed; Q3 Sent viewed	Sent	2 / 3 sent Quotes viewed.
Q1 Accepted; Q2 Sent; Q3 Draft	Won	Won has precedence. Other Quotes remain for audit but do not reopen the Deal.
Q1 Expired; Q2 Sent not viewed	Sent	0 / 1 sent Quote viewed. Expired Q1 is excluded.
Q1 Expired; Q2 Expired	Lost	No viable Quote remains; preserve per-Quote Expired status.
Q1 Cancelled; Q2 Draft	In Progress	Cancelled Q1 is excluded; Q2 remains viable.
Q1 Cancelled; Q2 Cancelled	Archived status	Not Lost and not another Pipeline Stage.
Q1 Sent expires; Q2 Draft remains	In Progress	Resolver recalculates backwards to the highest remaining viable state.

8. Phase 1 Automation runtime

An Automation is a versioned, Stage-scoped flow. Drafts are configuration data only; runtime always executes the current Active published version. Stage movement and CRM work are separate concerns, even when one event causes both in sequence.

EVENT
Receive a supported CRM or Quote event

>

SCOPE
Match Owning Company, then fixed Pipeline Stage

>

VERSION
Load Active published snapshot only

>

RULE
Evaluate saved conditions and Yes / No branches

>

ACTION
Run saved actions or wait safely

>

AUDIT
Write Activity, History and result state

Runtime contract

VERSION SAFETY

- Draft never changes the live flow
- Active published version continues while a Draft exists
- Publish atomically replaces the live snapshot
- Later edits mark any previous Test as outdated

EXECUTION SAFETY

- Each run stores Automation version and source event
- Branches execute only their own saved path
- Missing optional data ends safely
- Retries must not duplicate an already-completed result

VISIBLE CRM RESULT

- Notes, Meetings and Next Actions appear in Deal Activity
- Labels, Interests, Owner and Expected Close update the Deal
- File requests appear in Needs your attention
- Every result is written to History

Required-work checkpoint flow

ATTEMPT
User starts a Stage move or Quote lifecycle action

>

COLLECT
Load every unfinished Custom and Quote requirement

>

DIALOG
Have you completed the required tasks?

>

RESOLVE
Upload file or Mark complete inline

>

CONTINUE
Enable only when the list is empty

>

RESUME
Retry the original protected action

File-request rule

Requested file is received must point to a real named File Request already stored on the Deal. That request may have been created earlier in the same Stage, in a previous Stage, or manually. The event completes the matching requirement; it is never an unbound generic signal.

9. Phase 1 editing, validation and publishing

Customers can publish a safe change without being forced to Test every minor edit. Testing remains available and strongly recommended. It becomes mandatory only when validation identifies a blocking conflict that cannot be proven safe from configuration alone.

State behaviour

STATE	WHAT THE USER SEES	PUBLISH BEHAVIOUR
No Draft changes	Save Draft disabled; Before / After shows No unpublished changes and points to Timeline	No change to publish
Unpublished changes	Save Draft enabled; CURRENT - PUBLISHED compared with AFTER - DRAFT	Publish available when validation passes
Test passed	Test passed - Just now	Publish available
Test outdated	Shown after any edit following a successful Test	Publish still available unless conflict requires a new Test
Blocking conflict	Exact step and reason are highlighted	Publish disabled until fixed or successfully re-tested

Examples of blocking conflicts

- A required Action is missing mandatory configuration
- A Move Deal target Stage was deleted or is no longer valid
- Requested file is received references a removed File Request
- A branch creates a circular Stage movement
- A protected lifecycle milestone is used as a generic Move Deal target
- A Wait or retry path cannot end safely

Simulator contract

Test automation saves a safe Test Draft snapshot and never changes live CRM data. Timeline is the default tab with Play, Step, Reset and Speed. Before & After shows the CRM records and fields that would actually change - not two duplicate Pipeline diagrams.

10. Phase 1 customer creation journey

Primary customer flow

STEP 1	STEP 2	STEP 3	STEP 4	STEP 5	STEP 6
Choose the fixed Quote Lifecycle Stage	Choose Use a Template or Start from scratch	Choose All Companies or selected Companies	Edit Starts when, Rules and Actions	Save Draft and optionally Test	Publish unless a blocking conflict exists

Protected Quote Lifecycle progression

PROGRESSION	TRUSTED EVENT
Qualified -> In Progress	First related Quote is created
In Progress -> In Review	Quote is submitted for internal review
In Review -> Passed Review	Review passes
Passed Review -> Sent	A viable Quote is sent
Sent -> Won	A relevant Quote is accepted
Sent -> Lost	No viable related Quote remains

Engineering guardrail

These trusted events remain outside the editable block library. Automation can prepare work and enforce required checkpoints, but it cannot redefine or directly move the protected Quote Stage.

11. Phase 1 design artifact mapping

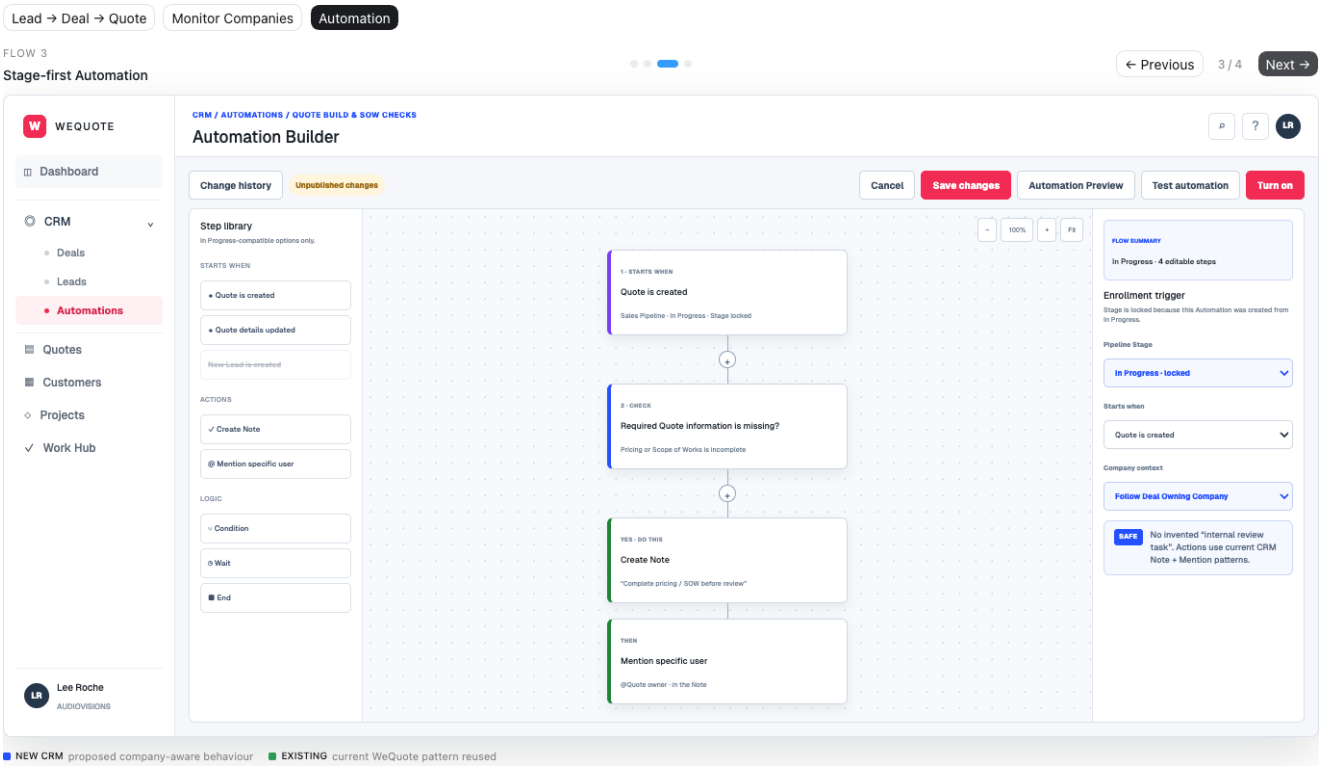

These purpose-built product artifacts express the intended interaction contract and connect the functional requirements to concrete UI states.

Evidence rule

Prototype references inform the design review, while the PRD uses self-contained artifacts that Product, Engineering, the CTO and external reasoning tools can assess independently.

Artifact 1 - Stage-first Automation Builder

This purpose-built UI artifact shows one Automation inside the fixed In Progress Stage: compatible workflow blocks on the left, the saved flow in the centre, and fixed Stage plus Company context on the right.

PRD contract represented

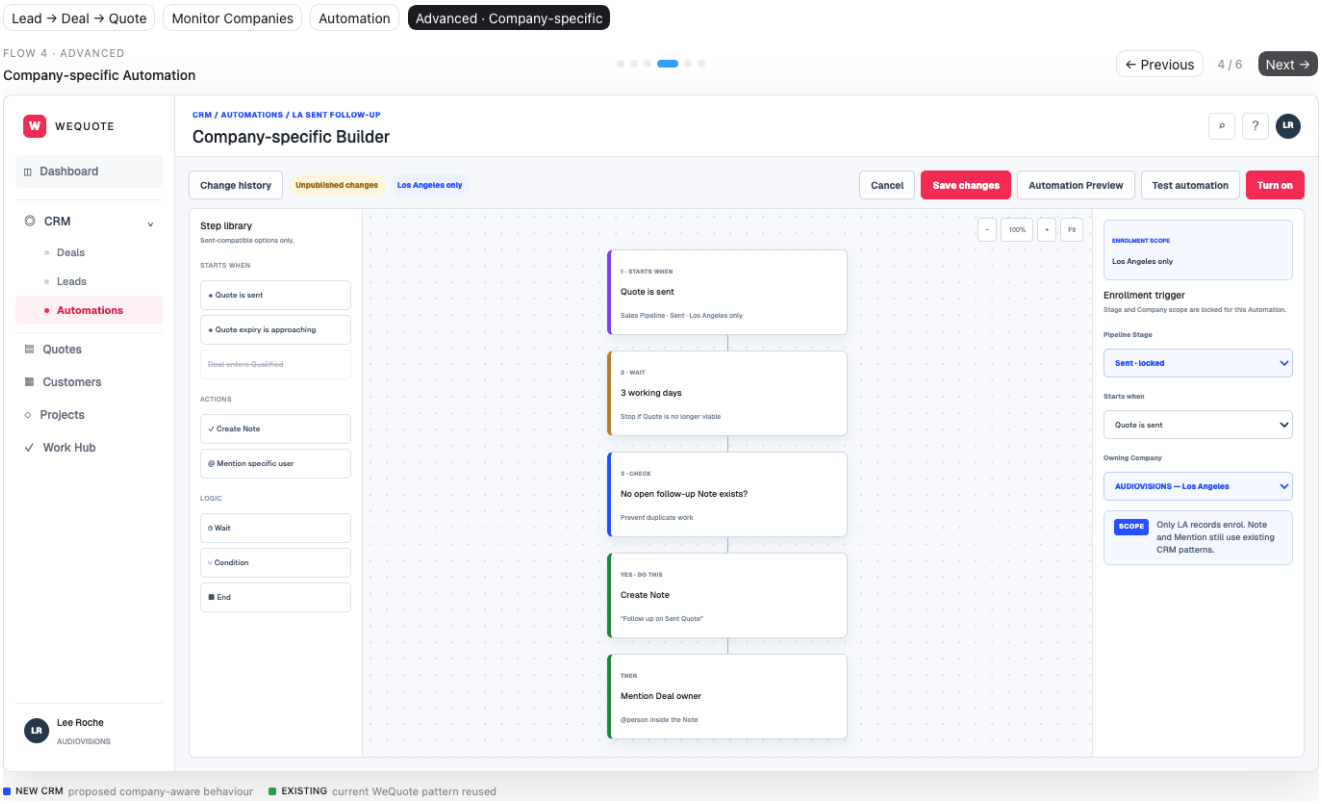

FR-01 Stage-first creation; FR-04 Global catalogue; FR-05 Shared Actions; FR-07 Draft, optional Test and Publish.

Interpretation note

The artifact is a design contract, not a claim that every visible control already exists in the current live WeQuote UI.

Artifact 2 - Company-specific Automation scope

This purpose-built UI artifact shows the same Builder scoped to one Owning Company. Company scope is visible in the editor and is evaluated before the published flow can run.

PRD contract represented

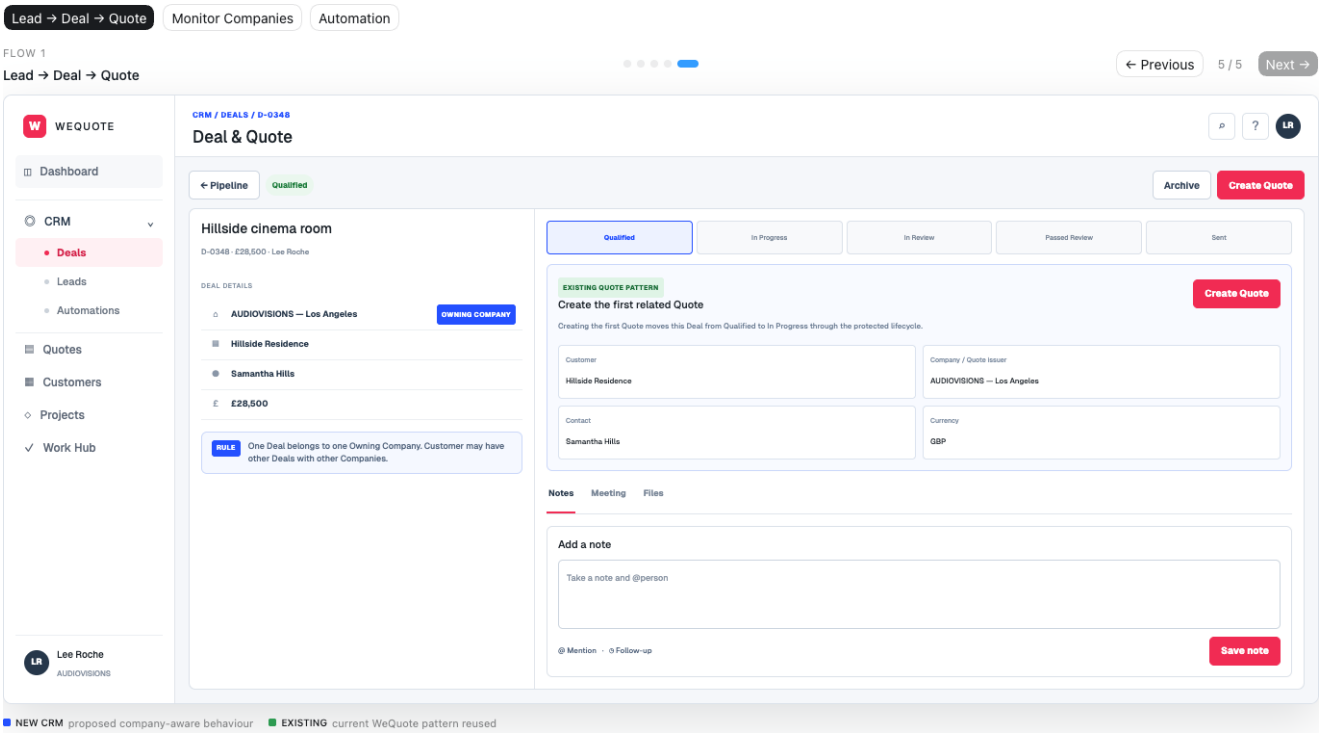

FR-08 Company scope and auditability; FR-19 Deal Owning Company; FR-20 Scope before execution.

Interpretation note

Audio Vision company names in the PRD remain illustrative; the product must use the Organisation's configured Company records.

Artifact 3 - Deal to first Quote lifecycle transition

This purpose-built UI artifact shows a Qualified Deal, its Owning Company, the protected Quote lifecycle strip and the action to create the first related Quote. It makes the CRM-to-Quote hand-off and protected progression visible in one screen.

PRD contract represented

FR-11 Protected Quote mapping; FR-16 Multi-Quote outcomes; FR-19 Deal Owning Company.

Interpretation note

Creating the first related Quote is the trusted event that derives In Progress. An Automation may prepare work and enforce checkpoints, but it does not replace or redefine that lifecycle transition.

12. Phase 1 ready-made Stage Template Pack

TARGET PHASE 1 PACK	CURRENTLY CONNECTED	PROTOTYPE GAP
12	11	1
Across seven protected Stages	Present in Stage definitions	Connect High-value approval

Template behaviour

Selecting a Template copies the flow into an editable, Inactive Draft. The protected Stage remains fixed. Before creation, the customer chooses All Companies or selected Companies. Testing is optional unless a conflict is detected. Publishing updates the Automation, not the definition of the Quote Lifecycle.

Qualified Templates

Qualified first Next Action

DEFINED

STARTS WHEN	Deal enters Qualified
RULE	No open Deal Next Action exists
ACTION	Set Next Action - Deal owner - due in 1 working day

Qualified inactivity reminder

DEFINED

STARTS WHEN	Deal enters or remains in Qualified
RULE	Wait 7 working days; still Qualified and no recent activity
ACTION	Create Note - mention Deal owner - follow up next working day

Site visit and pre-Quote readiness

DEFINED

STARTS WHEN	Deal enters Qualified
RULE	Site Visit, SOW or technical information is incomplete
ACTION	Create readiness Note - mention Deal owner - require completion before first Quote

In Progress Templates

Quote build and SOW checks

DEFINED

STARTS WHEN	First Quote is created or edited
RULE	Required pricing, product or SOW information is missing
ACTION	Create Note - mention Quote owner - due today

In Review Templates

Internal Quote review

DEFINED

STARTS WHEN	Quote is submitted for internal review
RULE	No open technical review Note exists
ACTION	Create Note - mention reviewer - follow up today

Passed Review Templates

Ready-to-send check

DEFINED

STARTS WHEN	Quote becomes Passed Review
RULE	Quote is viable and customer-facing content is complete
ACTION	Create ready-to-send Note - mention Quote owner

High-value approval

CONNECT

STARTS WHEN	Quote reaches Passed Review
RULE	Configured Review Over Quote Value or Review Over Discount threshold is exceeded
ACTION	Create Note - mention one approver - due today

Sent Templates

Sent Quote follow-up

DEFINED

STARTS WHEN	Quote is sent to the customer
RULE	Wait 3 working days; Quote is still Sent and not Expired
ACTION	Create Note - mention Deal owner

Quote expiry reminder

DEFINED

STARTS WHEN	Quote expiry date is 3 days away
RULE	Quote is still Sent and remains viable
ACTION	Create expiry follow-up Note - mention Deal owner

Won Templates

Won Deal handoff

DEFINED

STARTS WHEN	Quote is accepted and Deal becomes Won
RULE	No open Deal Next Action exists
ACTION	Create handoff Note - mention Deal owner

Accepted Quote to Draft Invoice

DEFINED

STARTS WHEN	Quote is accepted
RULE	Project and Invoicing are enabled and an eligible deposit is available
ACTION	Create Draft Invoice - Finance review required

Lost Templates

Lost Deal reason follow-up

DEFINED

STARTS WHEN	Deal becomes Lost because no viable Quote remains
RULE	Loss reason is empty
ACTION	Create Note - mention Deal owner to record reason

13. Phase 1 Start from scratch Block Catalogue

Shared Core - identical in all seven Stages

SHARED CORE STARTS WHEN	SHARED CORE RULES	SHARED CORE ACTIONS
• Deal Owner changes • Deal Next Action changes or becomes due • Meeting or Site Visit changes • File added or requested file received • Deal inactivity • Expected Close Date approaching • Deal data changes	• Owner or Next Action missing • Required task or file missing • Meeting or Site Visit complete • Recent Activity exists • Label, Interest, Value or Company matches • Expected Close Date matches	• Assign Deal Owner • Set or Clear Deal Next Action • Create Note • Schedule Meeting or Site Visit • Add or Remove Watcher, Label or Interest • Request or Attach file • Set Expected Close Date • Send internal notification

One source of truth

Implement one Global Block Catalogue with Stage compatibility metadata. Do not create seven separate libraries. The Shared Core block IDs, names and settings remain identical everywhere.

Stage-specific additions

Actions do not change. Each selected Stage only adds the Quote events and Quote-state Rules that can genuinely exist there. Protected system progression remains outside the editable library.

Qualified	ADDITIONAL STARTS WHEN	ADDITIONAL RULES	ACTIONS	OUTSIDE LIBRARY
	• Deal enters Qualified	• No related Quote exists • Deal is still Qualified	Same Shared Core Actions. No Stage-specific Action additions.	First Quote created -> In Progress. Not an Automation Action.

In Progress	ADDITIONAL STARTS WHEN	ADDITIONAL RULES	ACTIONS	OUTSIDE LIBRARY
	• First Quote created • Quote edited • Pricing or SOW changes	• Quote is Draft / In Progress • Pricing or SOW incomplete • Quote Review enabled	Same Shared Core Actions. No Stage-specific Action additions.	Submit for Review -> In Review. If Review is off, Send -> Sent.

In Review	ADDITIONAL STARTS WHEN	ADDITIONAL RULES	ACTIONS	OUTSIDE LIBRARY
	• Quote submitted for review • Review Note changes	• Quote is still In Review • Reviewer or approval missing • Technical review Note open	Same Shared Core Actions. No Stage-specific Action additions.	Review passes -> Passed Review. Automation cannot approve.

Passed Review	ADDITIONAL STARTS WHEN	ADDITIONAL RULES	ACTIONS	OUTSIDE LIBRARY
	• Quote becomes Passed Review	• Quote remains viable • Customer-facing content complete • Additional approval required	Same Shared Core Actions. No Stage-specific Action additions.	Quote sent -> Sent. Automation cannot send.

Sent	ADDITIONAL STARTS WHEN	ADDITIONAL RULES	ACTIONS	OUTSIDE LIBRARY
	• Quote is sent • Customer views Quote • Expiry approaching	• Quote is still Sent • Quote viewed or not viewed • Quote remains viable • Quote not expired	Same Shared Core Actions. No Stage-specific Action additions.	Accepted -> Won; no viable Quote -> Lost. System-derived outcomes.

Won	ADDITIONAL STARTS WHEN	ADDITIONAL RULES	ACTIONS	OUTSIDE LIBRARY
	• Quote is accepted • Deal becomes Won	• Accepted Quote exists • Deposit required • Handoff incomplete	Same Shared Core Actions. No Stage-specific Action additions.	Terminal sales outcome. Automation may continue handoff work.

Lost	ADDITIONAL STARTS WHEN	ADDITIONAL RULES	ACTIONS	OUTSIDE LIBRARY
	• Deal becomes Lost • No viable Quote remains	• Loss reason missing • No viable Quote remains	Same Shared Core Actions. No Stage-specific Action additions.	Terminal sales outcome. All Quotes cancelled = Archived, not Lost.

Visible Start-from-scratch library

Shared Core blocks + selected Stage Quote blocks = the visible library. This is one catalogue filtered by compatibility, not a different library per Stage.

14. Phase 1 consolidation decisions

Retire the repeated Protected Stage document as a separate reference

Why the old document caused confusion

It repeated full Starts when, Rules and Actions under every Stage, made seven libraries appear to exist, mixed editable blocks with protected lifecycle progression, and looked too similar to the Template Pack.

Where the useful content now lives

Repeated CRM blocks move to Shared Core. Quote-only events and checks become Stage-specific additions. Stage movement becomes protected system progression outside the block library.

Final Phase 1 source of truth

CUSTOMER CHOICE 1

12 ready-made Templates grouped by protected Stage.

CUSTOMER CHOICE 2

Start from scratch using Shared Core plus Stage-specific compatible Quote blocks.

SYSTEM BOUNDARY

Quote Lifecycle progression remains protected and is never an editable Action.

Open product decisions before development

DECISION	PROPOSED PHASE 1 ANSWER
Company entity vs Trading Name	Store a required Deal Owning Company ID and map it to an issuing Trading Name. Confirm whether one database entity can safely serve both roles.
Cross-company Quotes	Block linking a Quote issued by another Company to an existing Deal unless the user explicitly reassigns the Deal Company with impact confirmation.
Relevant Quote family	Use one latest enabled revision per Quote family. Historical and disabled proposal links do not affect the Deal aggregate or engagement denominator.
Backward aggregate movement	Allow resolver correction when a higher-stage Quote becomes Cancelled or Expired; write the reason to Deal History.
Forecast	Defer CRM Deal forecast and weighted probabilities to Phase 2. Keep current Sales Overview behaviour unchanged.

Glossary

TERM	DEFINITION
Quote status	The state stored or derived for one Quote or Quote revision in WeQuote.
Deal Stage	The single protected CRM result derived from all related relevant Quotes.
Viable Quote	A related Quote that can still progress toward acceptance. Cancelled, Expired, disabled and historical revisions are not viable.
Relevant Quote	The latest enabled revision in a Quote family that is allowed to participate in Deal aggregation.
Owning Company	The required Company assigned to a Deal and used for CRM visibility and Automation enrollment.
Trading Name	The existing WeQuote issuing identity selected on a Quote, with its own name, logo, addresses and VAT number.

15. Phase 1 functional requirements

FR-01	**Stage-first creation** The customer must select one fixed Quote Lifecycle Stage before choosing how to create the Automation. The selected Stage remains fixed for that Automation.
FR-02	**Exactly two creation routes** The UI must present Use a Template and Start from scratch. No third Protected Stage library route is exposed.
FR-03	**Template compatibility** Only Templates assigned to the selected Stage are shown. Selecting one creates an editable, Inactive Draft and does not alter the published Automation.
FR-04	**Single global catalogue** Start from scratch must load Shared Core blocks plus compatible Quote-specific Starts when and Rules from one catalogue with Stage metadata.
FR-05	**Shared Actions** The same CRM Actions must be available in all seven Stages. Engineering must not duplicate Action definitions by Stage.
FR-06	**Protected progression** First Quote creation, Review submission, Review pass, Send, Won and Lost remain trusted Quote events outside the editable block library.
FR-07	**Draft, Test and Publish** Edits create unpublished Draft changes. Testing is available but optional unless validation detects a blocking conflict. Publish requires confirmation.
FR-08	**Company scope and auditability** Every Automation has a required Company scope: All Companies or one or more selected Owning Companies. Scope is visible in creation, the Builder, Before / After, Publish confirmation and Change history.
FR-09	**Stage-compatible wording** Starts when and Rule labels must describe a precise event or condition that can genuinely happen in the selected Stage.
FR-10	**Conditional Review Stages** In Review and Passed Review Templates and Quote-specific blocks appear only for organisations where Quote Review is enabled.

FR-11	**Protected Quote mapping** Trusted Quote events must derive Qualified, In Progress, In Review, Passed Review, Sent, Won and Lost as specified. Archived and Expired remain statuses, not customer-created Pipeline Stages.
FR-12	**Published-version runtime** Runtime executes only the Active published snapshot. A Draft or Test Draft must never change live CRM data or replace the current published version.
FR-13	**Required-work gate** A Stage move or protected Quote lifecycle action must collect every unfinished requirement, show the blocking dialogue, keep Continue disabled, and resume the original action only after all items are resolved.
FR-14	**Bound file-request events** Requested file is received must reference a real named File Request on the Deal. Uploading the matching file resolves Focus, History, card status and the requirement automatically.
FR-15	**Visible Deal outputs** Created Notes, Meetings, Site Visits, Next Actions, file requests and due dates must be visible in Deal Activity and, where operationally relevant, on the Deal card. Automation results cannot exist only in Change history.
FR-16	**Multi-Quote outcomes** Deal Stage is derived from the aggregate of all relevant latest Quote records. Any Accepted or Complete Quote derives Won. Lost is derived only when no viable Quote remains. When every related Quote is cancelled, the Deal receives Archived status rather than Lost.
FR-17	**Idempotent execution** Each run must retain the source event and Automation version and must not duplicate an already-completed Note, Meeting, Next Action, file request or Stage movement when retried.
FR-18	**Pipeline type is explicit** When later phases add Pipeline creation, the user must choose Quote-connected or Fully Custom at the start. The system must not implement 'remove Quote Lifecycle' as a conversion shortcut.
FR-19	**Deal Owning Company** Every Deal has one required Owning Company. Phase 1 related Quotes inherit that Company / issuing identity so cross-company Quote links cannot silently change Automation eligibility.
FR-20	**Scope before execution** Runtime must match Owning Company and fixed Pipeline Stage before loading an Active published snapshot. A Draft, Test Draft or out-of-scope Automation must never execute.

FR-21	**Sent Quote engagement** A Deal in Sent shows X / Y sent Quotes viewed. Y counts only the latest enabled customer-facing revision of each viable Sent Quote; Cancelled, Expired, disabled and historical revisions are excluded.
FR-22	**Aggregate precedence and recalculation** Won has absolute precedence. Otherwise the highest viable Quote state determines the protected Deal Stage. If that Quote becomes non-viable, the resolver recalculates and may move the Deal back to the highest remaining viable state.
FR-23	**Roadmap boundary** CRM Deal forecast views, weighted probabilities and forecast controls are Phase 2. Phase 1 does not introduce CRM filter or sorting requirements in this PRD.

16. Phase 1 acceptance criteria and delivery plan

Acceptance criteria

1. Every fixed Stage can be opened even when it has zero Automations.

2. Create Automation first asks Use a Template or Start from scratch.

3. Both creation routes require All Companies or selected Companies before an Inactive Draft is created.

4. An Automation never executes for a Deal whose Owning Company is outside the published Company scope.

5. The Stage Template list contains only compatible Templates.

6. Start from scratch always contains the complete Shared Core library.

7. Stage selection adds Quote-specific Starts when and Rules without removing Shared Core Actions.

8. No editable block can directly change a protected Quote Stage.

9. A copied Template and a scratch-built flow use the same Builder, Draft, Test and Publish behaviour.

10. Publish remains available without a Test unless a blocking conflict is detected.

11. The Active published version continues to run while a Draft or Test Draft exists.

12. Every protected Quote event produces the expected Deal Stage or non-Stage status and writes an auditable History entry.

13. Any accepted relevant Quote derives Won; no viable Quote derives Lost; all cancelled derives Archived status.

14. A Sent Deal card shows X / Y viewed using only viable Sent Quotes and one latest enabled revision per Quote family.

15. An Expired or Cancelled Quote is removed from the engagement denominator and the Deal aggregate is recalculated from the remaining viable Quotes.

16. A Schedule Meeting or follow-up Action created by Automation appears in Deal Activity and the Deal card instead of existing only in History.

17. Requested file is received cannot be saved until a valid Deal File Request is selected.

18. A required-work gate lists all unfinished items, supports inline completion, and resumes the exact original lifecycle action.

19. Retrying the same runtime event does not create duplicate Notes, Meetings, Next Actions or file requests.

20. No CRM Deal forecast, weighted probability, filter or sorting control is introduced as part of Phase 1 acceptance.

Delivery readiness and sign-off

TARGET	12 ready-made Templates
CONNECTED TODAY	11 Templates
GAP	Connect High-value approval as a Passed Review creation Template
DOCUMENTATION	Retire the older repeated Protected Stage block document as a separate source of truth

Stakeholder decision requested

Approve the three-phase direction and the Phase 1 implementation contract: two creation routes, the 12-Template target pack, required Company scope, one Global Block Catalogue, multi-Quote Deal aggregation, optional Testing unless conflict exists, and protected system progression. Confirm that CRM Deal forecast remains Phase 2.

Sign-off checklist

OWNER	CONFIRMATION	STATUS
Product	Approve Deal Owning Company terminology and multi-Quote precedence.	Open
CTO / Engineering	Approve one Global Block Catalogue, resolver order, idempotency and audit contract.	Open
Design	Approve Company scope creation screen, Flow Summary display and Sent engagement card.	Open
WeQuote domain owner	Confirm current Quote status, Trading Name, review, send, accept, expiry and cancellation facts.	Reviewed in this PRD
Roadmap	Keep CRM Deal forecast in Phase 2 and Fully Custom Pipeline in Phase 3.	Open
